# Abstract

This project focuses on automating employee data management using the ServiceNow platform.Organizations often maintain large amounts of employee information such as name, employee ID,department, designation, and contact details. Managing this data manually may lead to errors,data duplication, and time-consuming administrative work.The ServiceNow platform provides automation capabilities through Import Sets, Transform Maps,
and data relationships that help organizations efficiently manage employee records.

In this project, employee data is imported from external files such as Excel and automatically transformed into the ServiceNow employee table.The system reduces manual work, increases data accuracy, and improves data consistency.

Automation also enables faster processing of employee records and easier management of organizational information.

# Introduction

- Employee data management is an essential part of every organization. Human resource departments handle a large volume of employee records including

personal details, department information,job roles, and reporting structures. When this information is handled manually, it may lead to errors and inefficiencies.

- Modern organizations use automation tools to simplify this process. ServiceNow is a cloud-basedplatform that allows organizations to automate workflows and manage enterprise data efficiently.It provides several tools such as Import Sets, Transform Maps, and Flow Designer to automate
  data import and management.

- This project demonstrates how employee information can be automatically imported into ServiceNow.The automation reduces manual work and ensures accurate employee records. The system also allows
  relationships between tables such as employees, departments, and managers to be managed easily.

# Problem Statement

Many organizations still rely on manual entry of employee data into management systems.Manual data entry is slow and may result in incorrect or incomplete information.

**Common problems include:**

- Duplicate employee records
- Incorrect department assignment
- Time-consuming data entry process
- Lack of centralized employee data management

Therefore, an automated system is required to import and manage employee data efficientlyusing the ServiceNow platform.

## Objectives

The main objectives of this project are:

• To automate the process of importing employee data into ServiceNow.
• To reduce manual effort in employee data entry.
• To ensure accurate and consistent employee records.
• To establish relationships between employee and department tables.
• To improve overall HR data management efficiency.

# Scope of the Project

The scope of this project is limited to employee data management using the ServiceNow platform.The system focuses on importing employee details from external files and storing them in ServiceNow tables.

The project includes:
• Creating employee tables
• Importing employee data
• Transforming data using Transform Maps
• Linking related tables using dot walking
• Automating updates and notifications

The project does not include advanced HR management features such as payroll processing or performance evaluation systems.

# Literature Review

Enterprise platforms such as ServiceNow, SAP, and Oracle are widely used to manage organizational data. ServiceNow has gained popularity because of its flexibility and cloud-based architecture.Research shows that automation in data management improves accuracy and reduces operational costs. Import tools and data transformation features allow organizations to integrate information from multiple sources.ServiceNow provides Import Sets and Transform Maps that help organizations import largedatasets

efficiently. These features are commonly used in HR systems, IT service management,and customer support applications.

# Tools and Technologies

Platform: ServiceNow

Technologies used in this project:

- ServiceNow instance
- Import Sets
- Transform Maps
- Employee database tables
- Dot Walking
- Flow Designer for automation

These technologies help in importing, transforming, and managing employee data efficiently.

# Modules of the System

The project consists of the following modules:

1. Employee Data Import Module
 This module uploads employee data into ServiceNow using Import Sets.

2. Data Transformation Module
 Transform Maps convert imported data fields into the correct table fields.

3. Employee Record Management
 This module stores employee details in the ServiceNow employee table.

4. Relationship Mapping

Dot walking connects employee records with department and manager tables.

5. Automation Module

Workflows or Flow Designer automatically update records when new data is imported.

# Implementation

The implementation process involves configuring ServiceNow to automate employee data management.

Steps include:

- Creating an employee table
- Creating an Import Set table
- Uploading employee data files
- Mapping fields using Transform Maps
- Running the transform process
- Verifying employee records

Once the system is configured, employee data can be imported automatically.

# Step by Step Procedure

Step 1: Login to the ServiceNow platform.

Step 2: Create a custom Employee table.

Step 3: Prepare employee data in Excel format.

Step 4: Create an Import Set table in ServiceNow.

Step 5: Upload the employee data file.

Step 6: Create a Transform Map to map fields.

Step 7: Run the transform process.

Step 8: Verify imported employee records.

Step 9: Use dot walking to connect related tables.

Step 10: Automate updates using Flow Designer.

# Conclusion

Automating employee data management using ServiceNow improves organizational efficiency.The system reduces manual errors, saves time, and ensures accurate employee records.By using Import Sets, Transform Maps, and automated workflows, organizations can manage large volumes of employee data effectively. This project demonstrates how ServiceNow can be used as a powerful platform for enterprise data automation.
